myFinance — Personal Balance Sheet & Yearly Cashflow Forecast

A modular, client-side web application built with **HTML5**, **CSS3**, and compartmentalized **JavaScript** modules, designed to be hosted directly on **GitHub Pages**.

Compartmentalized Module Structure

All source files are separated by responsibility:

- `index.html` — Application shell, navigation tabs (`1) Balance Sheet`, `2) Yearly Cashflows and Forecast`), forms, chart containers, and the bottom `Run-Time Log & Error Diagnostics Console`.
- `styles.css` — Custom layout styles, animations, sticky table headers, custom scrollbars, and print rules.
- `logger.js` — Run-Time Logger & Error Handler module (`myFinance.Logger`). Captures run-time status, state updates, calculation summaries, and uncaught exceptions (`window.onerror`, `unhandledrejection`) with level filtering (`ALL`, `INFO`, `WARN`, `ERROR`, `DEBUG`), keyword search, error simulation, and JSON log export.
- `storage.js` — Local Storage & Excel Backup/Restore module (`myFinance.Storage`). Automatically saves and loads data in the user's browser `localStorage` and provides 1-click **Export Excel (`.xlsx`)** and **Import Excel (`.xlsx`)** via SheetJS (`XLSX`).
- `balanceSheet.js` — Balance Sheet & Financial Health module (`myFinance.BalanceSheet`). Manages **Liquid** and **Fixed** Assets (with **Productive** flags and **Yearly Return Rates**), **Short-Term** and **Long-Term** Liabilities, **Net Worth**, and 6 Financial Health Ratios.
- `cashflow.js` — Yearly Cashflows & Forecast module (`myFinance.Cashflow`). Auto-calculates year-by-year cashflows from **Current Age** to **Life Expectancy (Age of Decease)** using Current Age, Yearly Income, Expected Income Growth Rate, Investment Percentage, Yearly Cash Return Rate, Yearly Capital Growth Rate, Expected Inflation Rate, Target Retirement Age, and Yearly Spending in Retirement (Present Value).
- `charts.js` — Visualization module (`myFinance.Charts`). Renders 6 interactive Chart.js charts across the Balance Sheet and Yearly Cashflows tabs.
- `app.js` — Main Application Controller (`myFinance.App`). Orchestrates tab routing, Excel I/O triggers, modals, and module initialization.

Deploying to GitHub Pages

1. Upload all files (`index.html`, `styles.css`, `logger.js`, `storage.js`, `charts.js`, `balanceSheet.js`, `cashflow.js`, `app.js`, `README.md`) to the root of your GitHub repository.
2. In your repository on GitHub, navigate to **Settings** → **Pages**.
3. Under **Build and deployment**, select **Deploy from a branch**, choose your `main` branch and `/ (root)` folder, and click **Save**.
